Definition of Regular Expression

5

Kleene, 1956:

“Metalanguage for expressing the set of words accepted by a FA (i.e. to express Type-3 or regular languages)”

Example: given the alphabet $\Sigma = \{0,1\}$

0^*10^* is a word of the metalanguage representing the infinite words which

consist of a 1 preceded and followed by zero or more 0s

Definition of Regular Expression

6

- Regular expressions: rules that define exactly the set of words that are included in the language.
- Main operators:
 - **Concatenation:** xy
 - **Alternation:** $x | y$ (x or y)
 - **Repetition:** x^* (x repeated 0 or more times)
 x^+ (x repeated 1 or more times)

Definition of Regular Expression

7

- Given an alphabet Σ , the rules that define regular expressions of Σ are:
 - $\forall a \in \Sigma$ is a regular expression.
 - λ is a regular expression.
 - Φ is a regular expression.
 - If r and s are regular expressions, then

(r) $r \cdot s$ $r | s$ r^*
are regular expressions.

$$r^* = \bigcup_{i=0}^{\infty} r^i$$

Regular expressions and Regular Languages

10

Each RE describes a regular language

- Each RE α has a set of Σ^* associated, $L(\alpha)$, that is the RL described by α . This language is defined by:
 - If $\alpha = \Phi$, $L(\alpha) = \Phi$
 - If $\alpha = \lambda$, $L(\alpha) = \{\lambda\}$
 - If $\alpha = a$, $a \in \Sigma$, $L(\alpha) = \{a\}$
 - If α and β are RE $\Rightarrow L(\alpha | \beta) = L(\alpha) \cup L(\beta)$

Regular Expressions. Examples

11

Write the regular languages described by the following RE:

1) Given $\Sigma = \{a,b,\dots,z\}$ and $\alpha = (a|b|\dots|z)^*$, what is $L(\alpha)$?

2) Given $\Sigma = \{0,1\}$ and $\alpha = 0^*10^*$, what is $L(\alpha)$?

3) Given $\Sigma = \{0,1\}$ and $\alpha = 01|000$, what is $L(\alpha)$?

4) Given $\Sigma = \{a,b,c\}$ and $\alpha = a(a|b|c)^*$, what is $L(\alpha)$?

5) Given $\Sigma = \{a,b,c\}$ and $\alpha = albclb^2a$, what is $L(\alpha)$?

Equivalence of Regular Expressions

13

- Two RE are equivalent, $\alpha = \beta$, if they describe the same regular language, $L(\alpha) = L(\beta)$. Properties:

- $(\alpha | \beta) | \sigma = \alpha | (\beta | \sigma)$ (| is associative)
- $\alpha | \beta = \beta | \alpha$ (| is commutative)
- $(\alpha \cdot \beta) \cdot \sigma = \alpha \cdot (\beta \cdot \sigma)$ (\cdot is associative)
- $\alpha \cdot (\beta | \sigma) = (\alpha \cdot \beta) | (\alpha \cdot \sigma)$ (| is distributive regarding \cdot)
 $(\beta | \sigma) \cdot \alpha = (\beta \cdot \alpha) | (\sigma \cdot \alpha)$
- $\alpha \cdot \lambda = \lambda \cdot \alpha = \alpha$ (\cdot has a neutral element)
- $\alpha | \lambda = \lambda | \alpha = \alpha$ (| has a neutral element)

19

ANALYSIS PROBLEM (AF→RE): Given a FA, write the characteristic equations of each one of its states, solve them and obtain the requested RE.

- **CHARACTERISTIC EQUATIONS:** They describe all the strings that can be recognized from a given state:
 - An equation x_i is written for each state q_i
 - First member x_i ;
 - The second member has a term for each branch from q_i
 - Branches has the format $a_{ij} \cdot x_j$ where a_{ij} is the label of the branch that joins q_i with q_j , x_j is the variable corresponding to q_j
 - A term a_{ij} is added for each branch that joins q_i with a final state.
