Who Should Read this Guide

This guide is suitable for Aspen Plus users who want to model processes containing solids. Users should be familiar with the procedures covered in *Aspen Plus Getting Started Building and Running a Process Model* before starting these examples.

Introducing Aspen Plus

Aspen Plus can be used to model many processes involving solids. Some of the solids processing applications that have been modeled with Aspen Plus include:

- Bayer process.
- Cement kiln.
- Coal gasification.
- Hazardous waste incineration.
- Iron ore reduction.
- Zinc smelting/roasting.

All of the unit operation models (except Extract) and flowsheeting tools are available for use in modeling solids processing applications.

This book guides you in introducing solids to a simulation in Aspen Plus. The four sessions demonstrate the following concepts:

- Changing the global stream class.
- Defining solid components.
- Defining physical property methods for solid components.
- Defining component attributes for solid components.
- Defining a particle size distribution.
- Modifying the default particle size distribution.
- Accessing component attributes in a Fortran block.
- Modifying component attributes in a block.
- Using solids unit operation models.

Getting Started Modeling Processes with Solids assumes that you have an installed copy of the Aspen Plus software, and that you have done the sessions in *Getting Started Building and Running a Process Model* so that you are familiar with the basics of how to use Aspen Plus.

**CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

- - -

**ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70**

Why Use Solids Simulation?

The introduction of solids to a chemical process can affect the process in many ways. In all cases, the heat and mass balances of the process are changed, even if the solid essentially passes through the process as an inert component.

Simulation of the heat and mass balances of a solids process requires physical property models suitable for solid components. The physical property models used to characterize a liquid may not be relevant for solids.

In addition to specialized physical property models for solid components, accurate representation of the solids particle size distribution is required for some processes. For example, the separation efficiency of a cyclone is highly dependent on the size of the particles entrained in the feed gas.

Sessions in this Book

The sessions in this book guide you in building a flowsheet that uses solids.

This book includes the following hands-on sessions:

Follow the steps in this chapter	To learn how to
1 Modeling Coal Drying	Change the global stream class, define nonconventional solid components, specify physical properties for nonconventional solid components, specify streams with nonconventional solid components, and modify component attributes in a unit operation block.
2 Modeling Coal Combustion	Define conventional solid components, define a Fortran block to control solid decomposition.
3 Modeling Gas-Solid Separators	Modify the default particle size intervals; use solids-handling unit operation models.
4 Modeling Polymer Recovery	Use the component attribute GENANAL to characterize a nonconventional component, use the hydrocyclone model, the counter-current decanter model and the cyclone model.

Using Backup Files

We recommend that you perform all sessions sequentially in order to build the entire model. However, you can skip chapters and work on the session of your choice, using backup files containing simulation data.

Aspen results need to do files to

**CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

1 Modeling Coal Drying

In this simulation you will simulate a coal drying process.

You will:

- Change the global stream class.
- Define nonconventional solid components.
- Specify physical properties for nonconventional solid components.
- Specify streams with nonconventional solid components.
- Modify component attributes in a unit operation block.
- Use Help.
- Analyze the results.

Allow about 30 minutes to complete this simulation.

**CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70**

- - -

**ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70**

Coal Drying Flowsheet

The process flow diagram and operating conditions for this simulation are shown in the following figure. A wet coal stream and a nitrogen stream are fed to a drier. There are two products from the drier: a stream of dried coal and a stream of moist nitrogen.

To Start Aspen Plus

- 1 From your desktop, click **Start** and then select **Programs**.
- 2 Select **AspenTech | Aspen Engineering Suite | Aspen Plus 2004.1 | Aspen Plus User Interface**.

The **Aspen Plus Startup** dialog box appears. Aspen Plus displays a dialog box whenever you must enter information or make a selection before proceeding. In this simulation, use an Aspen Plus template.

- 3 Select **Template**.
- 4 Click **OK** to apply this option.

The **New** dialog box appears. Use this dialog box to specify the application type and the run type for the new run. Aspen Plus uses the application type

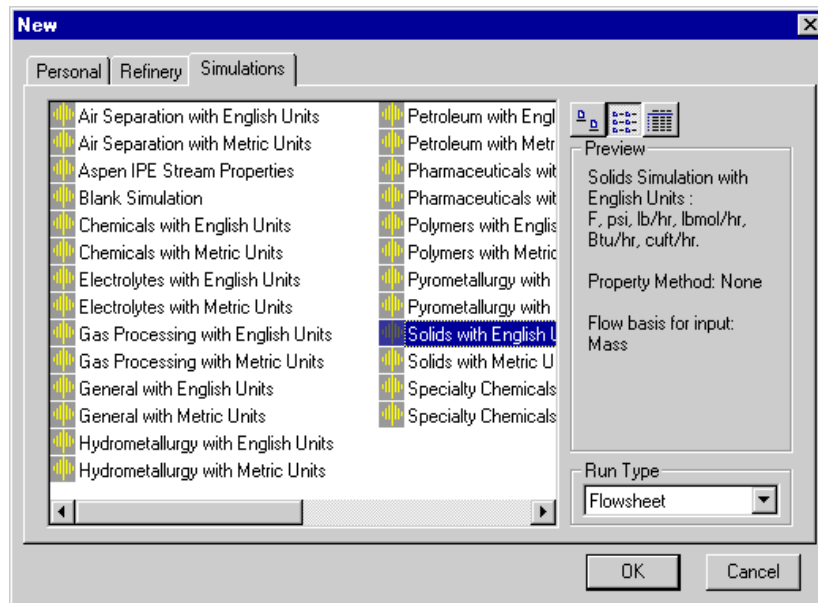

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

- - -

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

To Specify the Application Type and Run Type for the New Run

- 1 Select the **Solids with English Units** template.

The default run type, **Flowsheet**, is appropriate for this simulation.

- 2 Click **OK** to apply these options.

It takes a few seconds for Aspen Plus to apply these options.

Note: If the **Connect to Engine** dialog box appears, see Chapter 5.

The Aspen Plus main window is now active.

Drawing the Graphical Simulation Flowsheet

In this simulation, begin building the process flowsheet. Since you will enter your own block and stream IDs, turn off the automatic naming of blocks and streams, which provide these IDs automatically.

- 1 From the **Tools** menu, select **Options**.

The

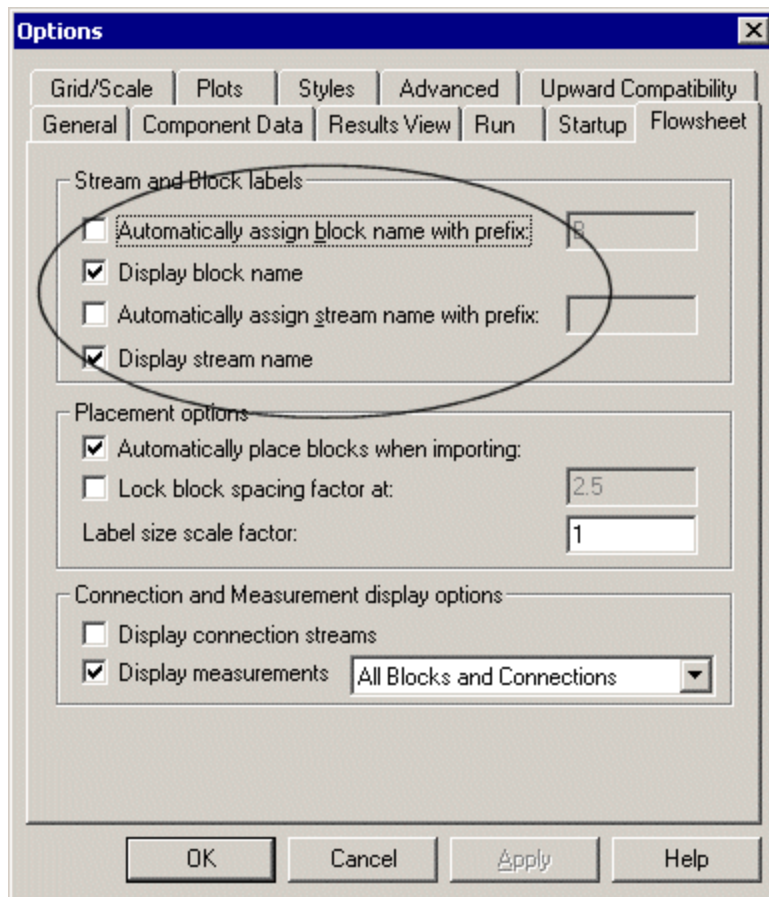

- 2 Sel

- 3 Cle

Au

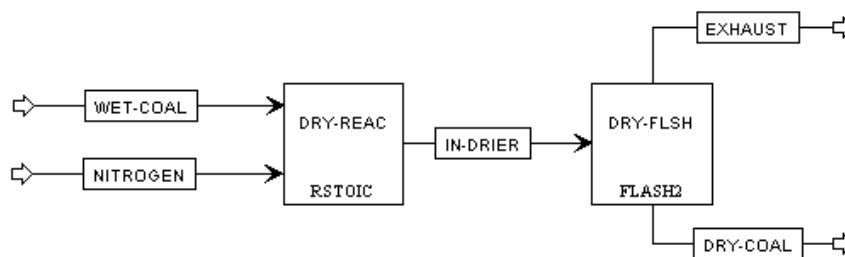

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

- 4 Click **OK** to close the **Options** dialog box and apply the changes.

The simulation flowsheet shown in the following figure feeds the WET-COAL stream and the NITROGEN stream to an RStoic model. In the RStoic block, a portion of the coal reacts to form water. Because the RStoic model has a single outlet stream, use a Flash2 model to separate the dried coal from the moist nitrogen.

- 5 Place the flowsheet blocks and streams to create the graphical simulation.

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
 LLAMA O ENVÍA WHATSAPP: 689 45 44 70

- 6 As

 ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
 CALL OR WHATSAPP:689 45 44 70

unit operation models to simulate a single piece of equipment. Also, the simulation flowsheet defines an extra stream (IN-DRIER) to connect the two simulation unit operation models. There is no real stream that corresponds to the simulation stream IN-DRIER.

- 7 Click  to continue.

The **Flowsheet Complete** dialog box appears.

Stream Classes and Substreams

Stream classes are used to define the structure of simulation streams when inert solids are present.

The default stream class for most simulations is CONVEN. The CONVEN stream class has a single substream: the MIXED substream. By definition, all components in the MIXED substream participate in phase equilibrium whenever flash calculations are performed.

To introduce inert solid components to a simulation, you must include one or more additional substreams. Aspen Plus has two other types of substreams available: the CISOLID substream type and the NC substream type.

The CISOLID substream (Conventional Inert Solid) is used for homogeneous solids that have a defined molecular weight. The NC substream (Nonconventional) is used for heterogeneous solids that have no defined molecular weight. Both the CISOLID substream and the NC substream give you the option of including a Particle Size Distribution (PSD) for the substream.

Substreams are combined in different ways to form different stream classes. The MIXNCPSD stream class contains two substreams: MIXED and NCPSD.

The default stream class of the Solids application type, MIXCISLD, is insufficient for this simulation since you will use an NC substream with a particle size distribution for the feed coal. In this simulation, use the MIXNCPSD stream class.

Specifying Title, Stream Properties, and Global Options

- 1 Click **OK** to continue.

The **Data Browser** window appears. The **Setup | Specifications |**

It is always good practice to describe your simulation by entering a title for the simulation.

- 2 In the **Title** field, enter the title *Getting Started with Solids – Simulation 1*.

The Solids with English Units application type sets the following global defaults for solids applications:

- *ENG* units (English Engineering Units).
- *Mass Flow Basis* for all flow inputs.
- The global stream class is *MIXCISLD*.

- 3 In the Stream Class field, click and select *MIXNCPSD*.

Global Description Accounting Diagnostics

- - -

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Since you chose the Solids with English Units application type when you started this simulation, Aspen Plus has set the following defaults for calculating and reporting stream properties:

- The component mass flow rates will be included in the stream report.
- The stream results will be displayed using the *SOLIDS* stream format.
- Property set *ALL-SUBS* (properties for the entire stream, all substreams combined) will be reported for each stream.

6 Click **Property Sets** to view the selected property sets.

7 Click **Close** to return to the **Stream** sheet.

8 Click  to continue.

The **Components | Specifications | Selection** sheet appears.

Specifying Components

The **Components | Specifications | Selection** sheet is used to enter the components present in the simulation. The components in this simulation are H₂O, N₂, O₂, and coal.

1 In the first four **Component ID** fields, enter H₂O, N₂, O₂, and COAL.

Because H₂O, N₂, O₂ and even COAL are present in the databanks, WATER, NITROGEN, OXYGEN, and COAL appear in the Component name field. Aspen Plus has a component named COAL in its SOLIDS databank, but

2 In the key

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

- 3 From the COAL **Type** field, click  and select *Nonconventional*.

The **Components | Specifications | Selection** sheet is now complete:

Component ID	Type	Component name	Formula
H2O	Conventional	WATER	H2O
N2	Conventional	NITROGEN	N2
O2	Conventional	OXYGEN	O2
COAL	Nonconventional		

- 4 Click  to continue.

The **Properties | Specifications | Global** sheet appears.

Defining Properties

The **Properties | Specifications | Global** sheet is used to select the thermodynamic methods used to calculate properties such as K-values, enthalpy, and density. Property methods in Aspen Plus are categorized into various process types.

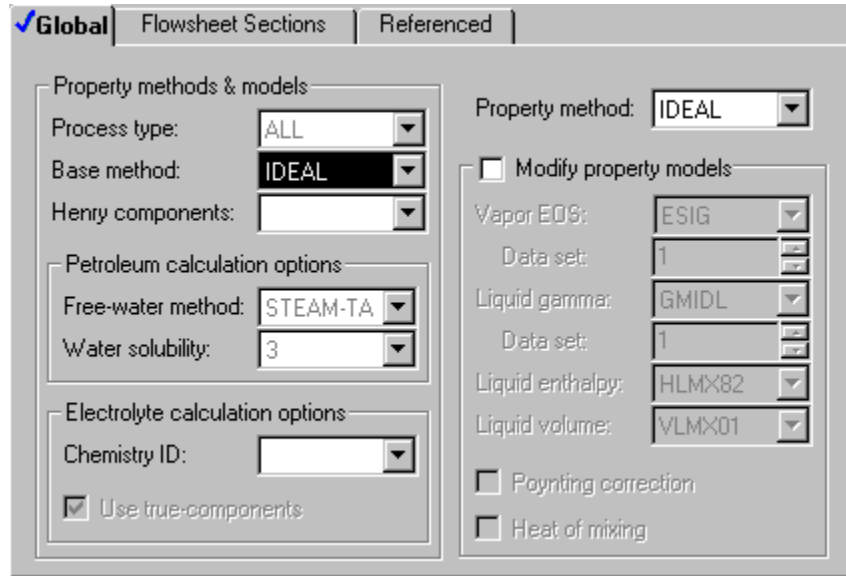

Because the physical property methods for solid components are the same for all property methods, select a property method based on the conventional components in the simulation.

The IDEAL property method (Ideal gas and Raoult's Law, as the prompt indicates) is a good choice for this simulation, since the process involves the conventional components H₂O, N₂, and O₂, at low pressure.

- 1 In the **Base method** field, click  and select IDEAL.

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

2 Click  to continue.

The **Properties | Advanced | NC Props | Property Methods** sheet appears.

Specifying Nonconventional Solid Physical Property Models

The **Properties | Advanced | NC Props | Property Methods** sheet is used to specify the models used to calculate the nonconventional solid properties. Because nonconventional components are heterogeneous solids that do not participate in chemical or phase equilibrium, the only physical properties that are calculated for nonconventional components are enthalpy and density.

In this simulation, use the HCOALGEN and the DCOALIGT models to calculate the enthalpy and density of coal.

1 In the **Model name** field for **Enthalpy**, click  and select *HCOALGEN*.

The component attributes PROXANAL, ULTANAL, and SULFANAL are automatically included in the **Required component attributes for the selected models** field for coal when you select HCOALGEN. Also, four **Option code value** fields with values of 1 appear.

Aspen Plus uses component attributes to represent nonconventional

CALL OR WHATSAPP:689 45 44 70

For More Information on the HCOALGEN Model

- 2 In the toolbar, click .
- 3 Click the **Model name** field for Enthalpy where you have selected *HCOALGEN*.
A small help window appears with the message: "Coal enthalpy model. Based on the Option code values entered, component attributes Ultanal, Sulfanal, and Proxanal may be required. For details see [Coal enthalpy](#)."
4 From the help window, click the [Coal enthalpy](#) hypertext link.
A larger help window appears, providing information on HCOALGEN, the General Coal Enthalpy Model.
- 5 Use the vertical scrollbar to access the **HCOALGEN Option Codes** table.
The help defines what each option code value means and the calculation methods available.
The calculation methods represented by the option code value defaults of 1, 1, 1 and 1 are acceptable for this simulation.
- 6 Click  in the top right corner to close the help window.
- 7 In the **Model name** field for **Density**, click  and select DCOALIGT.
The Property Methods sheet is complete:

Property Methods

Component: COAL

Property models for the selected nonconventional component

CALL OR WHATSAPP:689 45 44 70

The **Required Properties Input Complete** dialog box appears:

Correct representation of physical properties is an essential component of process modeling. For many simulations, the only physical property specification that you must provide is the selection of a property method. The **Required Properties Input Complete** dialog box shows that the Aspen Plus physical property system has many optional capabilities that you can use to increase the accuracy of physical property calculations.

- 9 Click **OK** to continue.

Entering Stream Data

The **Streams | NITROGEN | Input | Specifications** sheet appears. To specify a stream, Aspen Plus requires two thermodynamic specifications, and enough information to calculate the flow rate of each component.

Specifying the Nitrogen Stream

- 1 Enter the following specifications:

Temperature	270 F
Pressure	14.7 psi
Total flow	Mass 50000 lb/hr
Composition	Mole-Frac

- 2 Enter the following mole fractions:

N₂	CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

- 7 In the **Heat duty** field, enter 0.0 Btu/hr.
- 8 Click  to continue.

The **Blocks | DRY_REAC | Setup | Reactions** sheet appears.

This RStoic block models the drying of coal. Although coal drying is not normally considered a chemical reaction, you are using an RStoic block to convert a portion of the coal to form water. The following equation is the chemical reaction for coal drying:

Aspen Plus treats all nonconventional components as if they have a molecular weight of 1.0. The reaction indicates that 1 mole (or 1 lb.) of coal reacts to form 0.0555084 mole (or 1 lb.) of water.

The **Blocks | DRY-REAC | Setup | Component Attr.** sheet appears. On this sheet, enter the values for component attributes that change in this RStoic block. If you do not enter an attribute value, the attribute does not change.

- 10** In the **Substream** field, click and select *NCPD*.
- 11** In the **Component ID** field, click and select *COAL*.
- 12** In the **Attribute ID** field, click and select *PROXANAL*.
- 13** In the **Moisture** field, enter a value of 1.0. (The moisture content of 1.0 is a temporary value that you will override later with a Fortran block.)

- 14** Click to continue.

The **Required Input Complete** dialog box appears.

Although you could run your simulation now, you have not yet created the Calculator block to control the drying.

- 15** Click **Cancel**.
- 16** Close the **Data Browser**.

Using a Calculator Block to

$$COALIN * \frac{H2OIN}{100} = COALOUT * \frac{H2OOUT}{100} + COALIN * CONV \quad (1)$$

$$COALIN = COALOUT + COALIN * CONV \quad (2)$$

Where:

- COALIN = Mass flow rate of coal in stream WET-COAL
- COALOUT = Mass flow rate of coal in stream IN-DRIER
- H2OIN = Percent moisture in the coal in stream WET-COAL
- H2ODRY = Percent moisture in the coal in stream IN-DRIER
- CONV = Fractional conversion of coal to H₂O in the block DRY-REAC

Equation 1 is the material balance for water, and equation 2 is the overall material balance. These equations can be combined to yield equation 3:

$$CONV = \frac{(H2OIN - H2OOUT)}{(100 - H2OOUT)} \quad (3)$$

Use equation 3 in a Calculator block to ensure these three specifications are consistent.

The Calculator block specifies the moisture content of the dried coal and calculates the corresponding conversion of coal to water.

Using a Calculator block to set specifications allows you to run different cases easily.

- 1 From the **Data** menu, select **Flowsheeting Options | Calculator**.

The **Calculator** object manager appears.

- 2 Click **New** to create a new Calculator block.

The **Create new ID** dialog box appears, displaying an automatically generated Calculator ID, C-1.

- 3 Delete the ID C-1 and enter the ID *WATER* and click **OK**.

The **Flowsheeting Options | Calculator | WATER | Input | Define** sheet appears.

Use this sheet to access the flowsheet variables you want to use in the Calculator block. Define the three Calculator variables from equation 3: H2OIN, H2ODRY, and CONV.

H2OIN is the water content of the feed coal. The H2OIN variable accesses the first element (percent moisture) of the component attribute PROXANAL for component COAL in the NCPD substream of stream WET-COAL.

Creating the Other Variables

CONV and H2ODRY are block variables in the DRY-REAC block. CONV is the fractional conversion of the first (and only) reaction. H2ODRY is the moisture content of the coal leaving the RStoic block.

- 10** Click **New** to create another variable, CONV. Create the new CONV and H2ODRY variables as shown:

The screenshot shows the 'Variable Definition' dialog box. The 'Variable name' is set to 'CONV'. The 'Category' is 'Blocks'. The 'Reference' section is filled with: Type: 'Block-Var', Block: 'DRY-REAC', Variable: 'CONV', Sentence: 'CONV', and ID1: '1'.

The screenshot shows the 'Variable Definition' dialog box. The 'Variable name' is set to 'H2ODRY'. The 'Category' is 'Blocks'. The 'Reference' section is filled with: Type: 'Block-Var', Block: 'DRY-REAC', Variable: 'COMPATT', Sentence: 'COMP-ATTR', ID1: 'NCPST', ID2: 'COAL', ID3: 'PROXANAL', and Element: 'H'.

- 11** Click **Close** to close the dialog box.

- 12** Click  to continue.

Calculating the Conversion Variable

The **Calculator | WATER | Input | Calculate** sheet appears. Use this sheet to enter the Fortran statements you want Aspen Plus to execute to set H2ODRY and to calculate CONV from equation 3.

13 Enter the following Fortran statements:

```
H2ODRY = 10.0
```

```
CONV = (H2OIN - H2ODRY) / (100 - H2ODRY)
```

Note: Ensure that there are 6 spaces at the beginning of each line of the Fortran statements.

14 Click  to continue.

Specifying When the Calculator Block Should Run

The **Calculator | WATER | Input | Sequence** sheet appears. Use this sheet to specify when Aspen Plus should execute this Calculator block. Since you have used inline Fortran to modify the specifications for the RStoic block DRY-REAC, this Calculator block should execute immediately prior to DRY-REAC.

15 In the **Execute** field, click  and select *Before*.

16 In the **Block type** field, click  and select *Unit operation*.

17 In the **Block name** field, click  and select *DRY-REAC*.

Calculator block execution sequence

Execute: Block type: Block name:

List variables as import or export

18 Click  to continue.

The **Required Input Complete** dialog box appears.

Running the Simulation

1 Click **OK** to run the simulation.

The **Control Panel** window appears, allowing you to monitor and interact with the Aspen Plus simulation calculations.

As Aspen Plus performs the analysis, status messages display in the **Control Panel**.

The simulation completes without warnings or errors.

When the calculations finish, the message *Results Available* appears in the status area at the bottom right of the main window.

2 When the *Simulation Run Completed* message appears in the status bar, close the **Control Panel** window.

3 Examine the results of your simulation.

Examining Simulation Results

To View the Stream Results

1 From the **Control Panel**, click .

The **Results Summary | Run Status | Summary** sheet appears, indicating that the simulation completed normally.

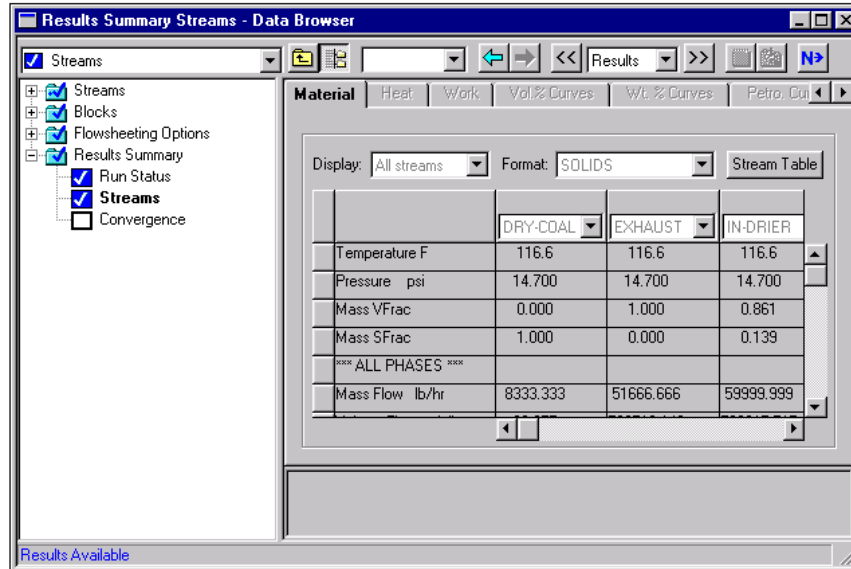

2 Click  to move to the next sheet with results.

The **Results Summary | Streams | Material** sheet appears.

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

- - -

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

- 3 Review the results on this sheet. Since this is a scrolling sheet, use the scrollbars to review results that are off the screen.

Aspen Plus populates the **Results Summary | Stream | Material** sheet using the SOLIDS format. The SOLIDS format reports results in three sections.

The top section reports the thermodynamic variables temperature pressure, vapor fraction, and solid fraction for the stream.

The second section, beginning with *****ALL PHASES*****, reports properties and component mass flow rates summed over all substreams. Examination of the component mass flow rates indicates that 1667 lb/hr of H₂O are removed from the coal by the drying process.

The third section, beginning with ***** SUBSTREAM NCPD *****, displays information that is appropriate only for the NCPD substream. In this case, it displays the component attributes for coal, and the overall particle size distribution for the NCPD substream. Note that the moisture in the PROXANAL is different for stream DRY-COAL and stream WET-COAL.

Stream summary results can also be displayed one substream at a time, by using the FULL format.

- 4 In the **Format** field, click  and select *FULL*.
- 5 Examine the results reported for the MIXED and NCPD substreams. When you are done, return to the SOLIDS Format.
- 6 From the Data Browser, expand the **Blocks** folder and select the **DRY-**

2 Modeling Coal Combustion

In this simulation, you will simulate a coal combustion process.

You will:

- Start with the simulation you created in Simulation 1.
- Modify the flowsheet.
- Change the default stream class.
- Add the components needed for combustion.
- Specify the unit operation models.
- Define a Fortran block to control the decomposition of coal.
- Analyze the results.

Allow about 45 minutes to complete this simulation.

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Opening an Existing Run

If You Completed the Simulation in Chapter 1 and Saved the Simulation

- 1 In the **Aspen Plus Startup** dialog box, select **Open an Existing Simulation**.
- 2 In the list, select Solid1.apw and click **OK**.

If Your Saved File Solid1.apw is Not Displayed

- 1 Double-click **More Files** in the list box.
The **Open** dialog box appears.
- 2 Navigate to the directory that contains your saved file Solid1.apw.
- 3 Select Solid1.apw in the list of files and click **Open**.

Note: If you did not create the simulation in Chapter 1, open the backup file solid1.bkp from the **Examples** folder.

To Access the Examples Folder

- 1 Double-click **More Files** in the list box.
The **Open** dialog box appears.
- 2 Click .

By default, the Favorites list contains five folders that are provided with Aspen Plus.

- 3 Double-click the **Examples** folder.
- 4 Select Solid1.bkp and click OK.

Note: If the **Connect to Engine** dialog box appears, see Chapter 5.

The
Cha

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

CALL OR WHATSAPP:689 45 44 70

Saving a Run Under a New Name

Before creating a new run, create and save a copy of Solid1 with a new Run ID, Solid2. Then you can make modifications under this new Run ID.

- 1 From the **Aspen Plus** menu bar, select **File | Save As**.
- 2 In the **Save As** dialog box, choose the directory where you want to save the simulation.
- 3 In the **File name** field, enter *Solid2*.
- 4 In the **Save as type** field, click  and select Aspen Plus Documents (*.apw).
- 5 Click **Save** to save the simulation and continue.

Aspen Plus creates a new simulation model, Solid2, which is a copy of the base case simulation, Solid1.

Drawing the Graphical Simulation Flowsheet

Use the RGibbs model to simulate combustion of the dry coal. RGibbs models chemical equilibrium by minimizing Gibbs free energy. However, the Gibbs free energy of coal cannot be calculated because it is a nonconventional component.

Before feeding the dried coal to the RGibbs block, decompose the coal into its constituent elements. This is done in the RYield block, DECOMP. The heat of reaction associated with the decomposition of coal must be considered in the coal combustion. Use a heat stream to carry this heat of reaction from the RYield block to the RGibbs block.

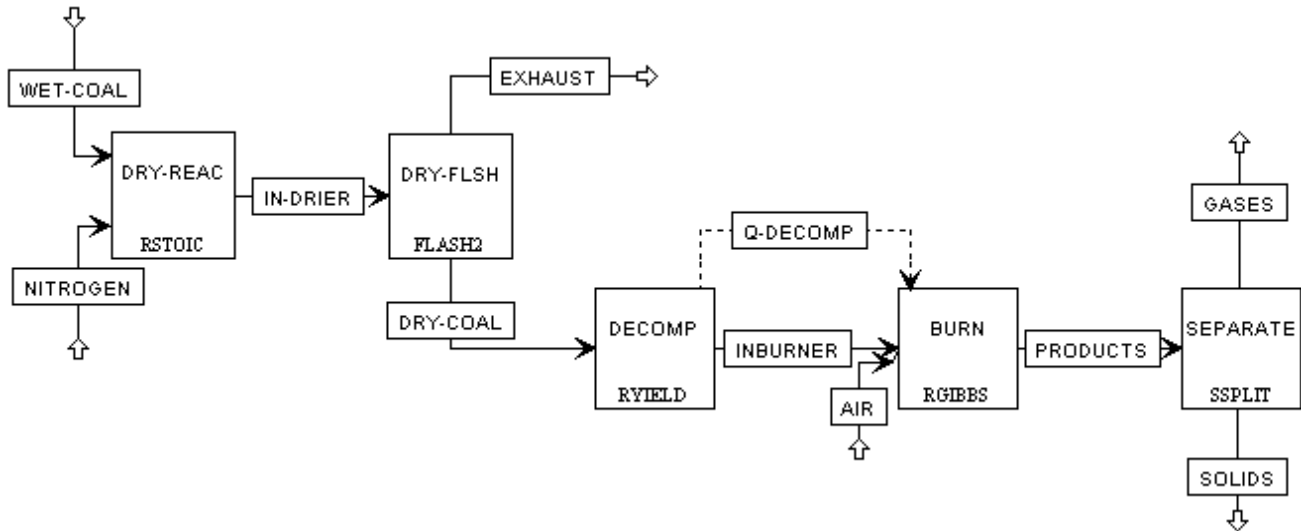

Finally, separate the combustion gases from the ash using the Aspen Plus model SSplit for this separation.

Modify the flowsheet to include the additional unit operation models and streams, as shown below. (See *Getting Started Building and Running a Process Model*, Chapter 2, if you need to review how to create a graphical simulation flowsheet.) You will add three unit operation models (an RYield, an RGibbs, and an SSplit), five material streams, and one heat stream.

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

- - -

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

The simulation flowsheet appears different from the process diagram in the previous figure because the simulation flowsheet uses two unit operation models to simulate a single piece of equipment. An extra stream (INBURNER) is defined to connect the two simulation unit operation models. There is no real stream that corresponds with the simulation stream INBURNER.

Changing the Stream Class

Because the decomposition of coal forms carbon, you must use a stream class that includes conventional solids. Use the *MCINCPD* stream class. *MCINCPD* contains the following substreams:

- MIXED
- CIPSD
- NCPSD

To Change the Global Stream Class

- 1 From the **Data** menu, select **Setup**.

The **Setup | Specifications | Global** sheet appears.

- 2 In the **Stream Class** field, click and select *MCINCPD*.
- 3 In the **Title** field, enter: *Getting Started with Solids – Simulation 2*.

- 3 Click  to continue.

The **Properties | Advanced | NC Props | Property Methods** sheet appears.

Defining Properties

Use the **Properties | Advanced | NC Props | Property Methods** sheet to specify the models used to calculate the nonconventional solid properties. In Simulation 1, Aspen Plus estimates the heat of coal combustion based on its PROXANAL, ULTANAL, and SULFANAL. In this simulation, enter the heat of combustion directly.

Change the Heat of Combustion Method for Coal

- 1 In the **Component** field, click  and select *COAL*.
- 2 In the toolbar, click .
- 3 Click the HCOALGEN **Model name**.
- 4 Click the Coal Enthalpy link.
- 5 In the help window that appears, scroll down to the table **HCOALGEN Option Codes**.

The help screen indicates that the first option code defines how Aspen Plus calculates the heat of combustion. Aspen Plus has six methods for calculating the heat of combustion. Use the sixth method, *User input value*.

- 6 Close the help window.
- 7 Change the first HCOALGEN Option code value field from 1 to 6.

Specify the Heat of Combustion for Coal

You just specified that Aspen Plus will use a user-specified value for the heat of combustion of coal. Now you must specify that value.

- 11 From the Data Browser, select the **Properties | Parameters | Pure Component** folder.

The **Properties | Parameters | Pure Component** object manager appears.

- 12 Click **New**.

The **New Pure Component Parameters** dialog box appears.

The heat of combustion for coal is a Nonconventional type.

- 13 Select the **Nonconventional** option.

- 14 Delete the default name NC-1 and enter *HEAT* as the new name in the **Enter new name or accept default** field.

- 15 Click **OK**.

The **Properties | Parameters | Pure Component | HEAT | Input** sheet appears.

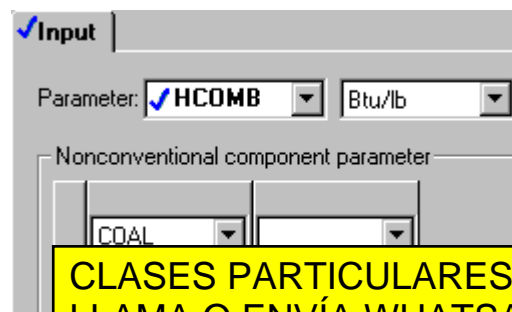

- 16 In the **Parameter** field, click  and select HCOMB.

Note that the prompt indicates that HCOMB is the heat of combustion on a dry basis. Use the following equation to convert the heat of combustion on a wet basis to a dry basis:

$$\text{HCOMB} = \text{Heat of Combustion (wet)} * \frac{100}{100 - \% \text{ Moisture}}$$

- 17 In the first line under the **Nonconventional component parameter** column, click  and select COAL.

- 18 In the parameter value field directly below COAL, enter the heat of combustion on a dry basis: 11700 Btu/lb.

- 19 Click **OK**.

The

Specify the RGibbs Reactor Model

On the **BURN | Setup | Specifications** sheet, enter your thermodynamic specifications. This reactor will be at atmospheric pressure.

- 1 In the **Pressure** field, enter 14.7 psi.

The heat duty for this reactor is specified by the heat stream Q-DECOMP.

- 2 In the Calculation options box, select **Phase equilibrium & chemical equilibrium**.

- 3 Select the **Products** tab.

The **BURN | Setup | Products** sheet appears. On this sheet, enter the list of products that may exist at equilibrium.

By default, RGibbs assumes that all of the components that are listed on the **Components | Specifications | Selection** sheet are potential products in the vapor phase or the liquid phase. This default is not appropriate for this simulation, since any carbon that remains after combustion would be solid.

- 4 Select **Identify possible products**.

The **Products** list appears.

For this simulation, all components are potential MIXED substream products, except for carbon, which is a solid product. Carbon must be assigned a phase of Pure Solid. This means that any carbon that forms will be present as a pure, solid phase, not present as a solid solution or alloy.

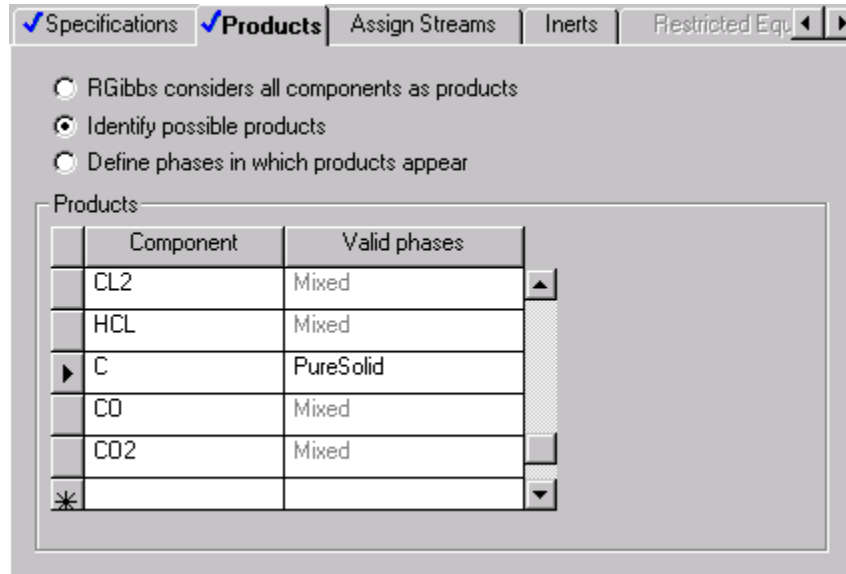

- 5 In the products list, enter the component species and phases shown below: (Be sure to change the Phase for C to Pure Solid.)

Component	Phase	Component	Phase
H2O	Mixed	SO3	Mixed
N2	Mixed	H2	Mixed
O2	Mixed	CL2	Mixed
NO2	Mixed	HCL	Mixed
NO	Mixed	C	Pure Solid
S	Mixed	CO	Mixed
SO2	Mixed	CO2	Mixed

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

6 Click  to continue.

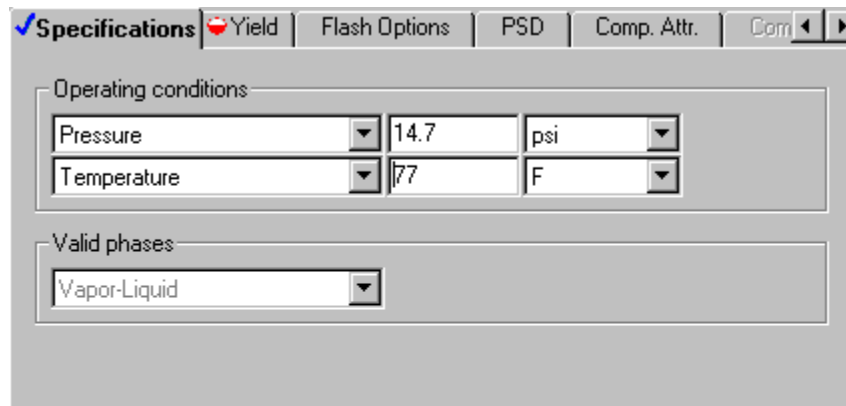

Specify the RYield Reactor Model

The **DECOMP | Setup | Specifications** sheet appears. RYield is used to simulate a reactor with a known yield, and does not require reaction stoichiometry and kinetics.

7 On the **DECOMP | Setup | Specifications** sheet, enter the pressure and temperature:

Pressure 14.7 psi

Temperature 77.0 F

8 Click

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

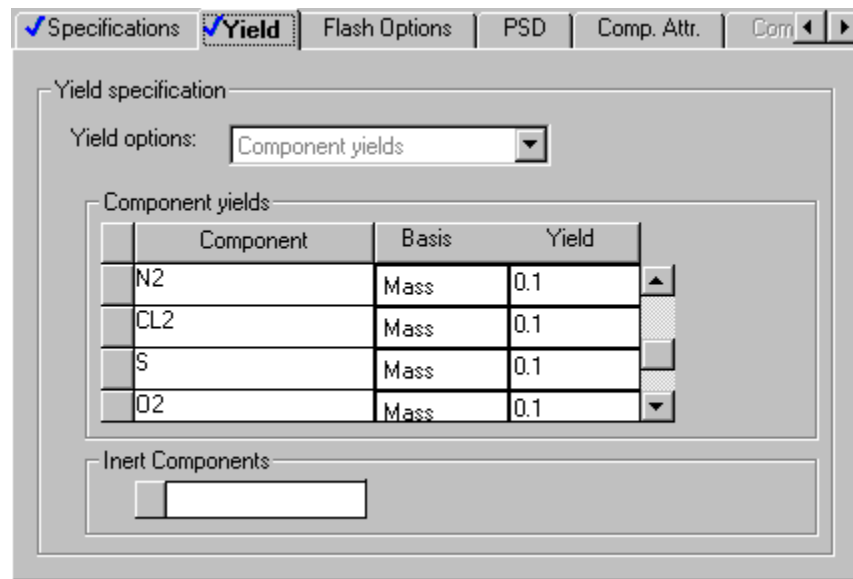

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

The **Yield** sheet appears.

For this simulation, the yield distribution you enter on this sheet is not the true yield distribution. Use a Calculator block to calculate the actual yield distribution from the component attributes for coal in the feed stream to the RYield model (stream DRY-COAL).

- 9 Enter the component yields as follows:

Component	Basis	Yield
H2O	Mass	0.2
ASH	Mass	0.2
C (CIPSD)	Mass	0.1
H2	Mass	0.1
N2	Mass	0.1
CL2	Mass	0.1
S	Mass	0.1
O2	Mass	0.1

In addition to the MIXED substream products, this RYield block forms carbon in the CIPSD substream and ash in the NCPSD substream. To fully specify the yield, specify the particle size distributions of the CIPSD and NCPSD substream and the component attributes of the ash that is formed.

Specify the Particle Size Distributions

- 1 Click the **PSD** tab.

The
2 In

- 3 Specify the weight fractions for the last four intervals of the particle size distribution for the carbon formed in the CIPSD substream:

Interval	Weight Fraction
7	0.1
8	0.2
9	0.3
10	0.4

It is not necessary to enter zero for intervals 1 through 6.

Substream ID: CIPSD

Particle size distribution

PSD ID: Units:

Interval	Lower limit	Upper limit	Weight fraction
5	80	100	
6	100	120	
7	120	140	0.1
8	140	160	0.2
9	160	180	0.3
10	180	200	0.4

You must also define the particle size distribution for the NCPSD substream.

- 4 In the **Substream ID** field, click and select *NCPSD*.
- 5 Enter the same weight fractions for the particle size distribution for the NCPSD substream that you entered for the CIPSD substream above.

Specify the Component Attributes for Ash

- 6 Click the **Comp. Attr.** tab.

The attributes PROXANAL, ULTANAL, and SULFANAL are required for RYield to calculate the enthalpy and density of ash.

- 7 In
- 8 In
- 9 In

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Specify the Splits for the SSplit Block

The **SEPARATE | Input | Specifications** sheet appears. SSplit mixes all of its feed streams, then splits the resulting mixture into two or more streams according to substream specifications. SSplit operates on substreams the same way a Sep block operates on components.

In this simulation, the SSplit block provides perfect separation between the gaseous products of combustion (MIXED substream) and the solid products of combustion (CIPSD and NCPSD substreams).

16 Enter the following split fraction values for the GASES outlet stream:

Substream Name	Value
MIXED	1.0
CIPSD	0.0
NCPSD	0.0

Substream Name	Specification	Basis	Value	Units
MIXED	Split fraction		1	%
CIPSD	Split fraction		0	%
NCPSD	Split fraction		0	%

17 Close the **Data Browser** window.

Defining a Calculator Block

You have completed enough specifications to run the simulation. However, the yields you specified in the RYield block were only temporary placeholders. You could directly enter the correct yields on the **RYield | Setup | Yield** sheet. However, by defining a Calculator block to calculate the yields based on the different substreams, you can avoid the need to manually enter the yields on the RYield sheet.

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Create the Calculator Block

- 1 From the Aspen Plus menu bar, select **Data | Flowsheeting Options | Calculator**.

The **Calculator** object manager appears.

- 2 Click **New** to create a new Calculator block.

The **Create new ID** dialog box appears with an automatically generated ID, C-1.

- 3 In the **Create new ID** dialog box, enter *COMBUST* as the ID and click **OK**.

Define the Calculator Variables

The **Calculator | COMBUST | Input | Define** sheet appears.

Use this sheet to access the flowsheet variables you want to use in the Fortran block. In the simulation in Chapter 1, you accessed individual elements of component attributes. You can also access component attributes as a vector. In this simulation, access the ultimate analysis of coal in stream DRY-COAL as a component attribute vector. Also define variables to access the moisture content of coal and the yield of each component in the DECOMP block.

- 4 Create and define the following two variables:

Variable Name	Type	Stream	Substream	Component	Attribute	Element
ULT	Compattr-Vec	DRY-COAL	NCPSD	COAL	ULTANAL	
WATER	Compattr-Var	DRY-COAL	NCPSD	COAL	PROXANAL	1

- 5 Also define the following eight mass yield variables.

Variable Name		ID1	ID2
H2O	Type <i>Block-Var</i> Block <i>DECOMP</i> Variable <i>MASS-YIELD</i> for all eight variables.	H2O	MIXED
ASH		ASH	NCPSD
CARB		C	CIPSD
H2		H2	MIXED
N2		N2	MIXED
CL2		CL2	MIXED
SULF		S	MIXED
O2		O2	MIXED

 CALL OR WHATSAPP:689 45 44 70

6 Click the **Calculate** tab.

Specify the Calculations to be Performed

The **Calculator | COMBUST | Input | Calculate** sheet appears.

ULTANAL is defined as the ultimate analysis on a dry basis. The variable WATER, defined as the percent H₂O in the PROXANAL for coal, is used to convert the ultimate analysis to a wet basis. The remaining eight variables (H₂O through O₂) are defined as the individual component yields of various species in the RYield block. ULT and WATER can then be used to calculate the yield of the individual species in the RYield block.

7 Enter the following Fortran statements:

```

C      FACT IS THE FACTOR TO CONVERT THE ULTIMATE ANALYSIS TO
C      A WET BASIS.
      FACT = (100 - WATER) / 100
      H2O  = WATER  / 100
      ASH  = ULT(1) / 100 * FACT
      CARB = ULT(2) / 100 * FACT
      H2   = ULT(3) / 100 * FACT

```

Stream PRODUCTS is the outlet of the RGibbs equilibrium reactor that models the combustion process. Since oxygen appears in stream PRODUCTS, the combustion process has excess air. An examination of stream PRODUCTS enables you to determine the most stable products for each atom in the combustion process:

- SO₂ is favored over SO₃ and S.
- N₂ is favored over NO and NO₂.
- CO₂ is favored over CO and C (solid).
- HCL is favored over CL₂.

7 Click  to access the next results sheet.

The **Results Summary | Streams | Heat** sheet appears.

This sheet displays the results for heat streams. Examine the results for Q-DECOMP. The heating value of Q-DECOMP represents the enthalpy change in breaking down the coal in stream DRY-COAL into its constituent elements.

Material		Heat	Load	Work	Vol.% Curves	Wt. % Curves
Display: All streams						
		Q-DECOMP				
	QCALC Btu/hr	-5506004.13				
	TBEGIN F	116.621847				
	TEND F	77.				

8 Close the **Data Browser** window.

View the Block Results

You do not need to view the results for Blocks DRY-REAC and DRY-FLSH, since they are unchanged from Simulation 1. View the results for blocks DECOMP, BURN, and SEPARATE.

9 In
10 Right-click

Summary	Balance	Phase Equilibrium	Weight distribution	Psi
RYield results				
Outlet temperature:	77	F		
Outlet pressure:	14.7	psi		
Heat duty:	5506004.13	Btu/hr		
Net heat duty:	5506004.13	Btu/hr		
Vapor fraction:	0.84137063			
1st liquid / Total liquid:	1			

- 11 Click  to access the next results sheet.

The **DECOMP | Results | Balance** sheet appears. Use this sheet to report the mass and energy balance for the block. Because RYield has a net reaction from nonconventional components to conventional components, the mass balance for both conventional components and nonconventional components is out of balance. However, the total mass balance is in balance.

- 12 Click  to access the next results sheet.

The **DECOMP | Results | Phase Equilibrium** sheet appears. This sheet indicates that the liquid from the RYield block is a solution of water and sulfur. In actuality, the sulfur would form a solid at this temperature. However, this fact does not matter for this simulation, because the stream (coal broken down into its constituents) does not exist in a real combustion process. This stream exists only as a mathematical construct to simplify the specification of the combustion process.

- 13 In the **Data Browser** menu tree, expand the list of forms for the **BURN** block and select **Results**.

The **BURN | Results | Summary** sheet appears. This sheet reports the outlet thermodynamic conditions of the RGibbs block. The outlet temperature is the adiabatic flame temperature of the coal with a fixed amount of excess air.

Summary	Balance	Phase Composition	Pure Solids	Atom Matrix
RGibbs results				
Outlet temperature:	2980.97915	F		
Outlet pressure:	14.7	psi		
Heat duty:	5506004.13	Btu/hr

3 Modeling Gas-Solid Separators

In this simulation, start with the simulation developed in Simulation 2, and add a rigorous gas-solid separation train to separate the ash from the combustion gases.

You will:

- Modify the default particle size intervals.
- Use solids-handling unit operation models.

Allow about 20 minutes to do this simulation.

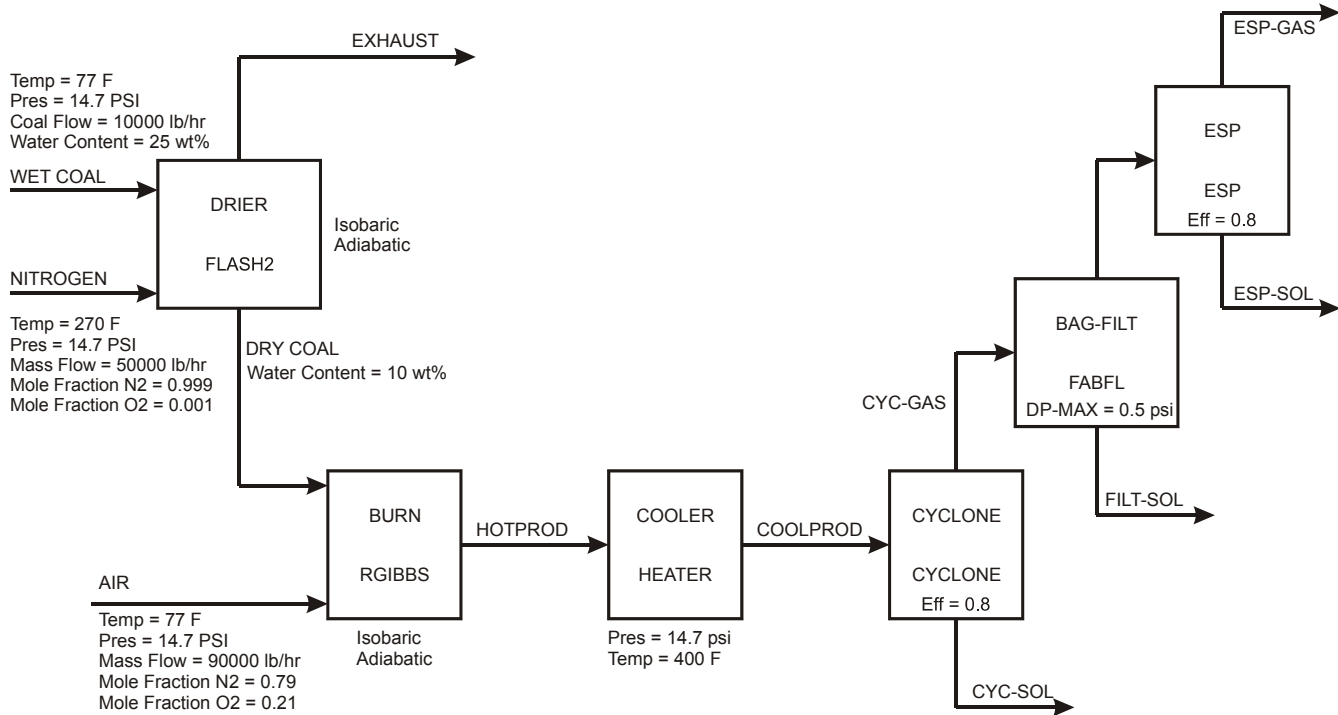

**CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70**

Opening an Existing Run

If You Completed the Simulation in Chapter 2 and Saved the Simulation

- 1 In the **Aspen Plus Startup** dialog box, select the radio button next to the Open an Existing Simulation field.
- 2 In the list, select Solid2.apw and click **OK**.

If Your Saved File Solid2.apw is Not Displayed

- 1 Double-click **More Files** in the list box.
The **Open** dialog box appears.
- 2 Navigate to the directory that contains your saved file Solid2.apw.
- 3 Select Solid2.apw in the list of files and click **Open**.
The **Aspen Plus** window appears.

Note: If you did not create the simulation in Chapter 2, open the backup file Solid2.bkp in the **Examples** folder.

To Access the Examples Folder

- 1 Double-click **More Files** in the list box.
The **Open** dialog box appears.
- 2 Click .
- 3 Double-click the **Examples** folder.
- 4 Select Solid2.bkp and click **OK**.

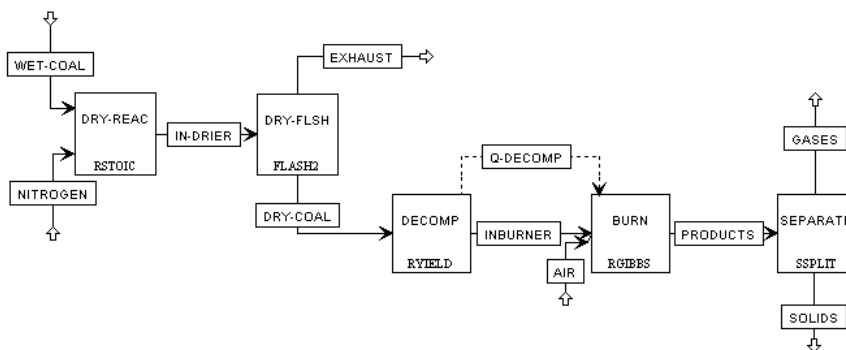

Note: If the **Connect to Engine** dialog box appears, see Chapter 5.

The process flowsheet from Chapter 2 appears:

Saving a Run Under a New Name

Before creating a new run, create and save a copy of Solid2 with a new Run ID, Solid3. Then you can make modifications under this new Run ID.

- 1 From the **Aspen Plus** menu bar, select **File | Save As**.
- 2 In the **Save As** dialog box, choose the directory where you want to save the simulation.
- 3 In the **File name** field, enter Solid3.
- 4 In the **Save as type** field, click and select *Aspen Plus Documents (*.apw)*.
- 5 Click **Save** to save the simulation and continue.

Aspen Plus creates a new simulation model, Solid3, which is a copy of the base case simulation, Solid2.

Drawing the Graphical Simulation Flowsheet

In the previous simulation, the SSplit block after combustion assumed perfect separation of the ash from the combustion gases. In the simulation in this chapter, replace the SSplit block with the following blocks in series: Heater, Cyclone, FabFI, and ESP.

- 1 Click **CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE**
- 2 Pre **LLAMA O ENVÍA WHATSAPP: 689 45 44 70**
- 3 In **---**
- 4 Dra **ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS**
Ru **CALL OR WHATSAPP:689 45 44 70**

graphical simulation flowsheet.) Change the name of the product stream of the RGibbs block and connect it to the new Heater block.

Changing the Default Particle Size Distribution

To Update the Title for This Simulation

- 1 From the **Data** menu, select **Setup**.

The **Setup | Specifications | Global** sheet appears.

- 2 Enter the new title *Getting Started with Solids—Simulation 3*.

Next, modify the system defaults for the size intervals in a particle size distribution:

To Modify the Particle Size Distribution Intervals

- 3 From the Data Browser, expand the **Substreams** folder.

4 From the Data Browser, select the **CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE** stream. The **LLAMA O ENVÍA WHATSAPP: 689 45 44 70** dialog box appears.

- 5 In the **CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE** dialog box, click **OK**.

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

- 6 Enter the following six intervals to describe the particle size distribution. Each **Upper** value is automatically copied to the next **Lower** value.

Interval	Lower [mu]	Upper [mu]
1	0	1
2	1	2
3	2	4
4	4	8
5	8	16
6	16	32

Updating Particle Size Distributions Previously Entered

Changing the intervals of the particle size distribution (PSD) modifies the particle size distributions you entered in the previous simulations.

- 1 In the Data Browser menu tree, select the **Streams | WET-COAL | Input** form.
- 2 Click the **PSD** tab.

The **Streams | WET-COAL | Input | PSD** sheet appears.

The original PSD for this stream used size intervals 7 through 10. Since you just deleted intervals 7 through 10, the PSD is now empty and you

Exiting Aspen Plus

When finished working with this model, exit Aspen Plus as follows:

- 1 From the **Aspen Plus** menu bar, select **File | Exit**.

The **Aspen Plus** dialog box appears.

- 2 Click **Yes** to save the simulation.

Aspen Plus saves the simulation as the Aspen Plus Document file, Solid3.apw, in your default working directory (displayed in the **Save in** field).

4 Modeling Polymer Recovery

In this simulation you will model a simplified polymer washing and drying process.

You will use:

- Component attribute GENANAL to characterize a nonconventional (NC) component.
- The hydrocyclone model (HyCyc).
- The counter-current decanter model (CCD).
- The cyclone model (Cyclone).

Allow about 30 minutes to do this simulation.

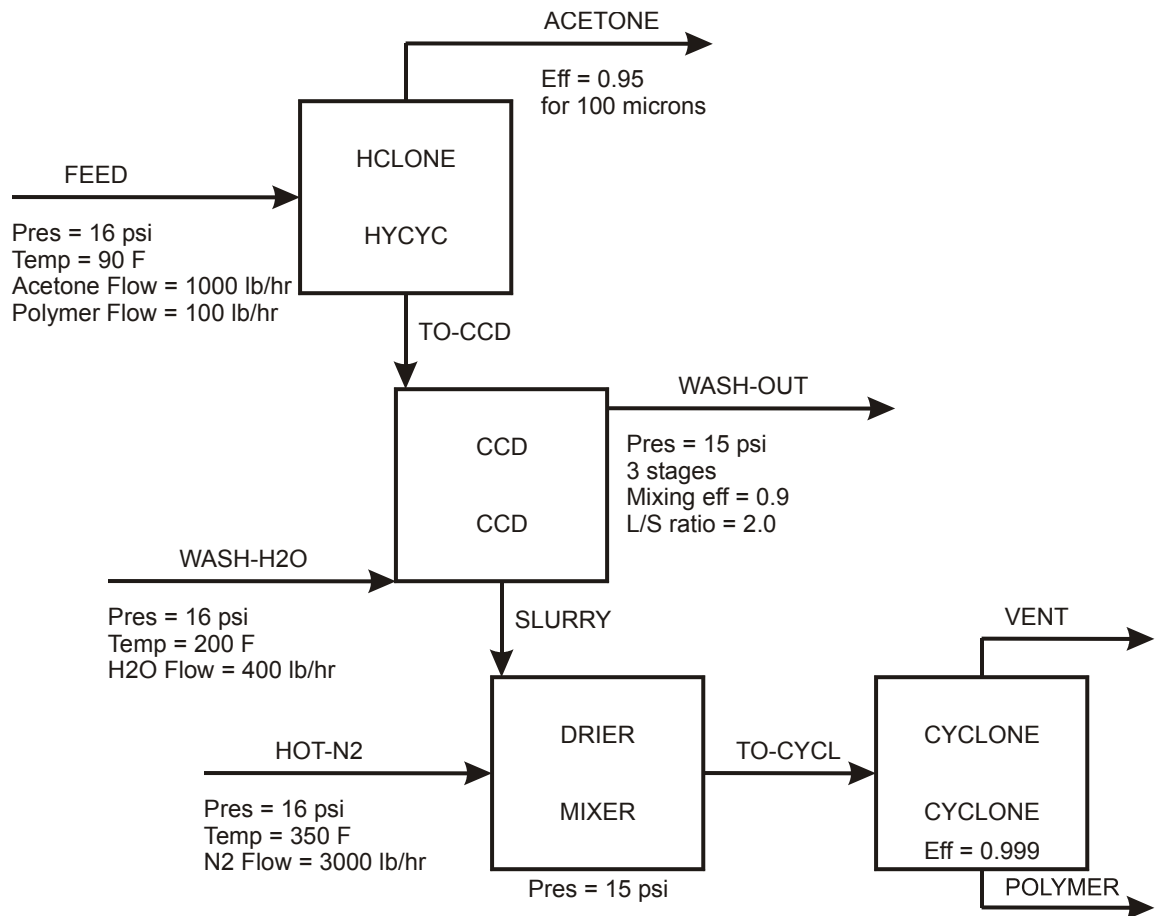

**CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE

**ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70**

Polymer Recovery Flowsheet

The process flow diagram and operating conditions for this simulation are shown in the following figure.

The feed stream FEED, a dilute slurry of polymer in acetone, is concentrated in a hydrocyclone. The concentrated slurry of polymer in acetone is then washed with water in a countercurrent decanter. The resulting slurry of polymer in water is dried with nitrogen. The gases from drying are separated from the solid polymer in a cyclone.

Starting Aspen Plus

- 1 Fro **CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE**
- 2 Sel **LLAMA O ENVÍA WHATSAPP: 689 45 44 70**
- Asp
- The
- Asp
- 3 Sel **ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS**
- CALL OR WHATSAPP:689 45 44 70**

- 4 Click **OK** to apply this option.

The **New** dialog box appears.

Use the **New** dialog box to specify the application type and the run type for the new run. Aspen Plus uses the application type you choose to automatically set various defaults appropriate to your application.

To Specify the Application Type and Run Type for the New Run

- 5 Select the *Solids with English Units* template.

The default **Run Type**, *Flowsheet*, is appropriate for this simulation.

- 6 Click **OK** to apply these options.

It takes a few seconds for Aspen Plus to apply these options.

Note: If the **Connect to Engine** dialog box appears, see Chapter 5.

The **Aspen Plus** main window is now active.

Drawing the Graphical Simulation Flowsheet

In this simulation, begin building the process flowsheet. Since you will enter your own block and stream IDs, turn off the automatic naming of blocks and streams, which provide these IDs automatically.

- 1 From the **Tools** menu, select **Options**.

The **Options** dialog box appears.

- 2 Select the **Flowsheet** tab.

- 3 Clear the **Automatically Assign Block Name with Prefix** and **Automatically Assign Stream Name with Prefix** checkboxes.

Specifying Title, Stream Properties, and Global Options

- 1 Click **OK** to continue.

The **Data Browser** window appears. The **Setup | Specifications | Global** sheet displays defaults Aspen Plus uses for other forms. Use this sheet to give your simulation a title, and to review the stream properties and global options that were set when you selected the Solids with English Units application type.

The Run type field displays *Flowsheet*, which is appropriate for this simulation.

It is always good practice to describe your simulation by entering a title for the simulation.

- 2 In the **Title** field, enter *Getting Started with Solids - Simulation 4*.

The Solids with English Units application type sets the following global defaults for solids applications:

- *ENG* units (English Engineering Units).
- *Mass Flow* basis for all flow inputs.

There are no other changes required on the **Setup | Specifications | Global** sheet.

The screenshot shows the 'Global' tab of the Aspen Plus configuration window. The 'Title' field contains the text 'Getting Started with Solids - Simulation 4'. Below this, there are two main sections: 'Units of measurement' and 'Global settings'. In the 'Units of measurement' section, both 'Input data' and 'Output results' are set to 'ENG'. In the 'Global settings' section, 'Run type' is 'Flowsheet', 'Input mode' is 'Steady-State', 'Stream class' is 'MIXNCPSD', 'Flow basis' is 'Mass', 'Ambient pressure' is '14.69595 psi', 'Ambient temp.' is '50 F', and 'Valid phases' is empty. At the bottom of the 'Global settings' section, there is an unchecked checkbox labeled 'Use free water calculations'.

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Since you chose the Solids with English Units application type when you started this simulation, Aspen Plus has set the following defaults for calculating and reporting stream properties:

- The component mass flow rates will be included in the stream report.
- The stream results will be displayed using the SOLIDS Stream Format.
- Property set ALL-SUBS (properties for the entire stream, all substreams combined) will be reported for each stream.

To Review the Report Options Specified in the Selected Template

- 1 From the **Data Browser** window, select the **Setup | Report Options** form.
- 2 Click the **Stream** tab to view the **Report Options | Stream** sheet.

The screenshot shows the 'Report Options | Stream' dialog box in Aspen Plus. The 'Stream' tab is active. The 'Generate a standard stream report' and 'Include stream descriptions' checkboxes are checked. Under 'Items to be included in stream report', the 'Flow basis' section has 'Mass' checked, and the 'Fraction basis' section has 'Mass' checked. The 'Stream format' dropdown is set to 'SOLIDS'. The 'Standard (80 column)' radio button is selected, and the 'Sort streams alphanumerically' checkbox is checked. At the bottom, there are buttons for 'Include Streams', 'Exclude Streams', 'Property Sets', 'Component Attributes', 'Stream Names', 'Batch Operation', and 'Supplementary Stream'.

- 3 Click **Property Sets** to view the selected property sets.
- 4 Click **Close** to return to the **Report Options | Stream** sheet.
- 5 Click  to continue.

The **Components | Specifications | Selection** sheet appears.

polyme

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

- 1 On the first four **Component ID** fields, enter H2O, ACETONE, N2, and POLYMER.

Aspen Plus is able to find WATER, ACETONE and NITROGEN in the databanks. POLYMER is not found, so the **Component name** field for polymer is empty.

By default, Aspen Plus assumes all components have a **Type** of *Conventional*, indicating that they participate in phase equilibrium calculations. Change the **Type** for POLYMER to indicate that it is a solid. Because POLYMER does not have a precise molecular weight, assign POLYMER the **Type** *Nonconventional*.

Component ID	Type	Component name	Formula
H2O	Conventional	WATER	H2O
ACETONE	Conventional	ACETONE	C3H6O-1
N2	Conventional	NITROGEN	N2
POLYMER	Nonconventional		
*			

- 2 In the **Type** field for POLYMER, click  and select *Nonconventional*.
- 3 Click  to continue.

The **Properties | Specifications | Global** sheet appears.

Defining Properties

Use the **Properties | Specifications | Global** sheet to select the thermodynamic methods used to calculate properties such as K-values, enthalpy, and density. Property methods in Aspen Plus are arranged according to process types.

Select a Property Method

All property methods use the same physical property models for solid components. Therefore, the selection of the appropriate property method depends on the components that participate in phase equilibrium. Since acetone and water form a non-ideal solution, use an activity-coefficient-based option set. For this simulation, use the NRTL property method.

- 1 In the **Base method** field, click  and select *NRTL*.

- 2 Click  to continue.

The **Properties | Parameters | Binary Interaction | NRTL-1 | Input** sheet appears.

On this sheet, Aspen Plus displays binary interaction parameters for the NRTL activity coefficient model. Binary parameters are retrieved for all binary combinations present in the database. If you had data for binary pairs, you could enter the data on this sheet.

Aspen Plus
available

In this example, parameters are retrieved for the acetone-water pair from the Aspen Plus VLE-IG databank. Aspen Plus displays the value of the parameters, and temperature range in which they were regressed. Use the vertical scrollbar at the bottom right to see all the parameter values.

- 3 Click  to continue.

Specify Nonconventional Component Property Methods

The **Properties | Advanced | NC Props | Property Methods** sheet appears.

Specify the methods for Aspen Plus to calculate the enthalpy and density of the nonconventional component POLYMER.

Use the general enthalpy model (ENTHGEN) and the general density model (DNSTYGEN) in this simulation.

- 4 In the **Model name** field for **Enthalpy**, click  and select *ENTHGEN*.
As soon as you select ENTHGEN, Aspen Plus assigns the attribute *GENANAL* to the component POLYMER.
- 5 In the **Model name** field for **Density**, click  and select *DNSTYGEN*.

Property models for the selected nonconventional component	
Model name	Option code value
Enthalpy	ENTHGEN
Density	DNSTYGEN

Required component attributes for the selected models	
GENANAL	

You use GENANAL to characterize a nonconventional solid in terms of the

**ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70**

In this simulation, use only the first constituent to characterize the component POLYMER. Thus, POLYMER will be composed of 100% constituent 1.

Specify Parameters Used to Calculate POLYMER Properties

Now provide Aspen Plus with the required parameters to calculate enthalpy and density for the nonconventional component POLYMER.

- 6** In the **Data Browser**, select the **Properties | Parameters | Pure Component** folder.

The **Properties | Parameters | Pure Component** object manager appears.

- 7** Click **New**.

The **New Pure Component Parameters** dialog box appears.

The enthalpy and density parameters for the POLYMER are of a Nonconventional type.

- 8** Select the *Nonconventional* option.

- 9** Click **OK** to accept the default ID, NC-1.

The **Properties | Parameters | Pure Component | NC-1 | Input** sheet appears.

The ENTHGEN model calculates enthalpy from the parameters DHFGEN and HCGEN. In this simulation DHFGEN (heat of formation) is not required since POLYMER does not participate in any chemical reactions. You must provide HCGEN (heat capacity). For this simulation, POLYMER is assumed to have a constant heat capacity of 0.45 Btu/lb-R.

- 10** In the **Parameter** field, click and select *HCGEN*.

- 11** In the first field in the **Nonconventional component parameter** frame, click and select *POLYMER*.

- 12** In the first parameter value field directly below, enter 0.45.

CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE
LLAMA O ENVÍA WHATSAPP: 689 45 44 70

ONLINE PRIVATE LESSONS FOR SCIENCE STUDENTS
CALL OR WHATSAPP:689 45 44 70

Input

Parameter: HCGEN Btu/lb-R Temperature units: F

Nonconventional component parameter

<input type="checkbox"/>	POLYMER	
<input type="checkbox"/>	0.45	
<input type="checkbox"/>		
<input type="checkbox"/>		
<input type="checkbox"/>		
<input type="checkbox"/>		
<input type="checkbox"/>		

The first four elements of HCGEN are used to calculate the heat capacity of the first constituent of GENANAL, using the following equation:

$$C_p = \text{HCGEN}(1) + \text{HCGEN}(2) \times T + \text{HCGEN}(3) \times T^2 + \text{HCGEN}(4) \times T^3$$

HCGEN(2), HCGEN(3) and HCGEN(4) default to zero. Since only the first constituent of GENANAL will be used to characterize POLYMER, POLYMER will have a constant heat capacity of 0.45 Btu/lb-R.

If POLYMER were characterized with other constituents, use elements 5 through 8 of HCGEN to calculate the heat capacity of the second constituent, and so on.

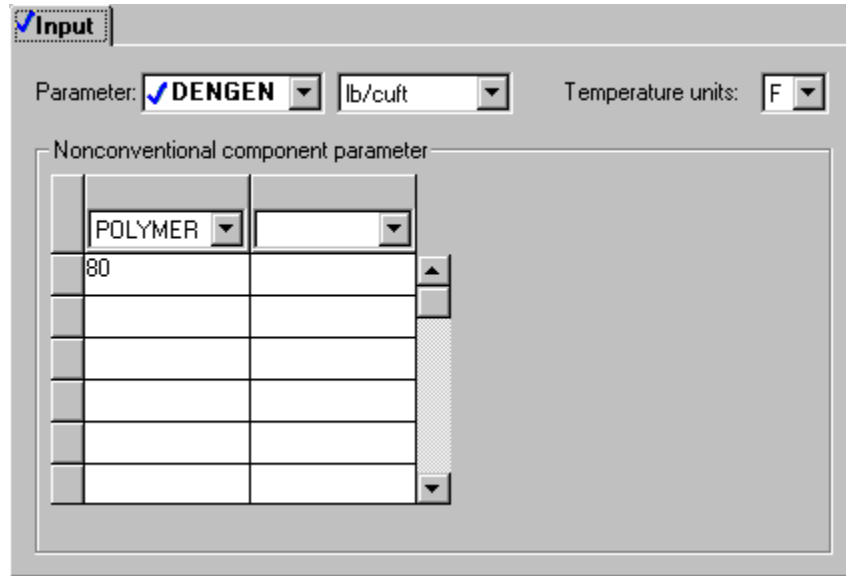

Enter the parameters required for the DNSTYGEN model on this sheet. DNSTYGEN calculates density for a nonconventional solid from the DENGGEN parameter. For this simulation, POLYMER is assumed to have a constant density of 80 lb/cuft.

- 13 In the **Parameter** field, click and select *DENGGEN*.
- 14 In the first field in the **Nonconventional component parameter** frame, click and select *POLYMER*.
- 15 In the first parameter value field, enter 80.

Entering Block Specifications

The **Blocks | CCD | Input | Specifications** sheet appears.

Enter Specifications for the CCD Model

Make the following specifications for a countercurrent decanter:

- Number of stages.
- Operating pressure.
- Mixing efficiency.
- Liquid/solid ratio.

If you do not provide mixing efficiency or liquid/solid ratio for all stages, Aspen Plus determines the values for missing stages by linear interpolation. If you provide only a single value for mixing efficiency or liquid/solid ratio, Aspen Plus uses that value for all stages.

By default, Aspen Plus assumes each stage of a countercurrent decanter to be adiabatic. Alternatively, you could specify a temperature, a heat duty, or a heat transfer coefficient for each stage.

1 Enter the following operating conditions:

Number of stages	3
Pressure	15.0 psi

2 For the stage profiles, enter:

Stage	1
Mixing efficiency	0.9
Liquid-to-solid mass ratio	2

The screenshot shows the 'Specifications' dialog box with the following data:

Operating conditions	
Number of stages:	3
Pressure:	15 psi
Ambient temperature:	77 F

Stage profiles		
Stage	Mixing efficiency	Liquid-to-solid mass ratio
1	0.9	2

CALL OR WHATSAPP:689 45 44 70

Enter Specifications for the HyCyc Model

You can use HyCyc in simulation mode or design mode. In this example, use HyCyc in design mode. In design mode, make the following specifications:

- Particle size for design efficiency.
- Design separation efficiency.
- Maximum diameter of the hydrocyclone.
- Maximum pressure drop.

7 In the **Mode** field, click  and select *Design*.

8 Enter the following specifications:

Diameter of solid particles 100 mu (microns)

Separation efficiency 0.95

Maximum diameter 1.5 ft

Maximum pressure drop 5.0 psi

Be sure to specify the units of measure for the particle diameter.

Field	Value	Unit
Mode	Design	
Efficiency correlation	Built-in	
Diameter of solid particles	100	mu
Separation efficiency	0.95	
Maximum diameter	1.5	ft
Maximum pressure drop	5	psi
Density of solid particles		lb/cuft

To help concentrate the solid slurry, change the default geometry of the hydrocyclone. Increasing the size of the overflow diameter increases the amount of liquid product in stream ACETONE. Specify that the ratio of the overflow diameter to the inlet diameter is 1.5.

9 Click

Running the Simulation

You have now entered the data and specifications for this simulation.

- 1 Click **OK** to run the simulation.

The **Control Panel** allows you to monitor and interact with the Aspen Plus simulations calculations.

As Aspen Plus performs the simulation, status messages display in the **Control Panel**.

GENANAL is defined as having 20 constituents. If you only use a portion of the constituents available in GENANAL, Aspen Plus generates a warning. Since you need only one element in GENANAL for this simulation, ignore this warning. The remainder of the simulation completes without warnings or errors.

When the calculations finish, the message *Results Available* appears in the status area at the bottom right of the main window.

- 2 Use the vertical scrollbar to see the messages.
- 3 Examine the results of your run.

Examining Results

To View the Stream Results

- 1 From the **Control Panel**, click .

The **Results Summary | Run Status | Summary** sheet appears, indicating that the simulation completed normally.

- 2 Click  to move to the next sheet with results.

The **Results Summary | Streams | Material** sheet appears.

- 3 Review the results on this sheet.

Note: Since this is a scrolling sheet, use the scrollbars to review results that are off the screen.

- 4 In the **Display** field, select *Streams*.

- 5 At the bottom of the sheet, click **CLASES PARTICULARES, TUTORÍAS TÉCNICAS ONLINE**

N2	3000.000	3000.000	3000.000	
POLYMER		99.602	0.100	99.502

The DRIER block operates by mixing streams SLURRY and HOT-N2. There is enough hot nitrogen to adiabatically evaporate all of the liquid in stream SLURRY ($V_{frac} + S_{frac} = 1$ in stream TO-CYCL).

The CYCLONE block separates the solid polymer from the gas. Because the Cyclone model neglects the interstitial flow of gas in the separated solids, stream POLYMER contains a small amount of acetone.

- 9 Clo

To View the Block Results

- 1 In the **Process Flowsheet** window, right-click the CCD block. From the shortcut menu, select **Results**.

The **CCD | Results | Summary** sheet appears. This sheet displays summary flow and temperature information for the first and last stages.

Summary		
Balance		
Profiles		
CCD results		
	Mass flow	Temperature
	lb/hr	F
Top stage feed:	260.428866	90
Bottom stage feed:	400	200
Total side feed:	0	
Top stage product:	361.623696	169.974076
Bottom stage product:	298.80517	194.419557
Side draw (under):	0	
Side draw (over):	0	
Total duty:	0	Btu/hr

- 2 Click  to move to the next sheet with results.

The **CCD | Results | Balance** sheet appears. This sheet displays the overall mass and energy balance for the block.

- 3 Click  to move to the next sheet with results.

The **CCD | Results | Profiles** sheet appears. This sheet displays the temperature, duty, underflow, and overflow for each stage of the CCD.

Summary					
Balance					
Profiles					
Stage	Temperature	Duty	Underflow	Overflow	Feed
	F	Btu/hr	lb/hr	lb/hr	lb/hr
1	169.974076	0	99.6017235	560.827143	260.428866
2	185.194297	0	99.6017235	599.203447	0

- 4 Click  to move to the next sheet with results.

- 5 In the **Process Flowsheet** window, right-click the CCD block. From the shortcut menu, select **Results**.

The **CYCLONE | Results | Summary** sheet appears. This sheet displays the calculated geometry for the cyclone.

Summary		Balance
Type of cyclone:	High Efficiency	
Number of cyclones:	1	
Diameter of cylinder:	2.30488322	ft
Efficiency:	0.9990009	
Length of vortex:	5.71057403	ft
Length of cylinder:	3.45732482	ft
Length of cone:	5.76220804	ft
Diameter of gas outlet:	1.15244161	ft
Length of gas outlet:	1.15244161	ft
Width of gas inlet:	0.46097664	ft

- 6 Click  to move to the next sheet with results.

The **CYCLONE | Results | Balance** sheet appears. This sheet displays the overall mass and energy balance for the block.

- 7 Close the **Data Browser** window.

- 8 In the **Process Flowsheet** window, right-click the DRIER block. From the shortcut menu, select **Results**.

The **DRIER | Results | Summary** sheet appears. This sheet displays the outlet thermodynamic conditions for the block.

Summary		Balance
Mixer results		
Outlet temperature:	117.92368	F
Outlet pressure:	15	psi
Vapor fraction:	1	
1st liquid/Total liquid:	1	

- 9 Click  to move to the next sheet with results.

The **DRIER | Results | Balance** sheet appears. This sheet displays the overall mass and energy balance for the block.

- 10 Close the **Data Browser** window.

- 11 In the **Process Flowsheet** window, right-click the DRIER block. From the shortcut menu, select **Results**.

The **DRIER | Results | Summary** sheet appears. This sheet displays the outlet thermodynamic conditions for the block.

The **DRIER | Results | Balance** sheet appears. This sheet displays the overall mass and energy balance for the block.

Summary		Balance
HyCyc results		
Number of hydrocyclones:	1	
Pressure drop:	0.04698575	psi
Length of cylinder:	2.09890401	ft
Diameter of cylinder:	0.4197808	ft
Diameter of inlet:	0.05998667	ft
Diameter of overflow:	0.12593424	ft
Diameter of underflow:	0.06296712	ft
Inlet liquid velocity:	2.02635729	ft/sec
Liquid volumetric flow per cyclone:	20.616694	cuft/hr

Exiting Aspen Plus

When you are finished working with this model, you can exit Aspen Plus as follows:

- 1 From the **Aspen Plus** menu bar, select **File | Exit**.
The **Aspen Plus** dialog box appears.
- 2 Click **Yes** to save the simulation.
- 3 In the **Save As** dialog box, enter the Run ID *Solid4* in the **File name** box.

Aspen Plus saves the simulation as the Aspen Plus Document file, *Solid4.apw*, in your default working directory (displayed in the **Save in** box).

This simulation is delivered as backup file *solid4* in the online Aspen Plus Examples Library. You can use this backup file to check your results.

5 Connecting to the Aspen Plus Simulation Engine

If either of the following conditions exist, you will be prompted to specify the host computer for the Aspen Plus simulation engine after you start the Aspen Plus User Interface:

- The simulation engine is not installed on your PC.
- The simulation engine is installed on your PC, but the Activator security device is not connected to your PC.

In these cases, the **Connect to Engine** dialog box appears.

- 1 In the **Server type** field, click and select the type of host computer for the simulation engine.

If you choose *Local PC* as the server for the simulation engine, you do not need to enter any more information into the dialog box.

If you choose *Windows 2000 or XP server* as the server for the simulation engine, enter additional information:

- 2 In the **Node name** field, enter the node name of the computer on which the Aspen Plus simulation engine will execute.
- 3 In the other fields, enter the following information:

User name Your user name for the specified host/server.

Password Your password for the above user name.

Working directory The associated working directory.

- 4 Click **OK** to continue.

- 5 When the network connection is established, the message *Connection Established* appears in the message box.

Note: If the *Connection Established* message does not appear, see your Aspen Plus system administrator for more information on network protocols and host computers for the Aspen Plus simulation engine.

Technical Support

Online Technical Support Center

AspenTech customers with a valid license and software maintenance agreement can register to access the Online Technical Support Center at:

<http://support.aspentech.com>

You use the Online Technical Support Center to:

- Access current product documentation.
- Search for technical tips, solutions, and frequently asked questions (FAQs).
- Search for and download application examples.
- Search for and download service packs and product updates.
- Submit and track technical issues.
- Search for and review known limitations.
- Send suggestions.

Registered users can also subscribe to our Technical Support e-Bulletins. These e-Bulletins proactively alert you to important technical support information such as:

- Technical advisories.
- Product updates.
- Service Pack announcements.
- Product release announcements.

Phone and E-mail

Customer support is also available by phone, fax, and e-mail for customers who have a current support contract for their product(s). Toll-free charges are listed where available; otherwise local and international rates apply.

For the most up-to-date phone listings, please see the Online Technical Support Center at:

<http://support.aspentech.com>
