# EDSGER WYBE DIJKSTRA

- May 11, 1930 – August 6, 2002
- Received the 1972 A. M. Turing Award, widely considered the most prestigious award in computer science.
- The Schlumberger Centennial Chair of Computer Sciences at The University of Texas at Austin from 1984 until 2000
- Made a strong case against use of the GOTO statement in programming languages and helped lead to its deprecation.
- Known for his many essays on programming

# SINGLE-SOURCE SHORTEST PATH PROBLEM

**Single-Source Shortest Path Problem** - The problem of finding shortest paths from a source vertex  $v$  to all other vertices in the graph.

# DIJKSTRA'S ALGORITHM

**Dijkstra's algorithm** - is a solution to the single-source shortest path problem in graph theory.

Works on both directed and undirected graphs. However, all edges must have nonnegative weights.

**Approach:** Greedy

**Input:** Weighted graph  $G=\{E,V\}$  and source vertex  $v \in V$ , such that all edge weights are nonnegative

**Output:** Lengths of shortest paths (or the shortest paths)

# DIJKSTRA'S ALGORITHM - PSEUDOCODE

```
dist[s] ← 0                (distance to source vertex is zero)
for all v ∈ V - {s}
  do dist[v] ← ∞          (set all other distances to infinity)
S ← ∅                      (S, the set of visited vertices is initially empty)
Q ← V                     (Q, the queue initially contains all vertices)
while Q ≠ ∅                (while the queue is not empty)
  do u ← mindistance(Q, dist) (select the element of Q with the min. distance)
  S ← S ∪ {u}             (add u to list of visited vertices)
  for all v ∈ neighbors[u]
    do if dist[v] > dist[u] + w(u, v) (if new shortest path found)
       then d[v] ← d[u] + w(u, v) (set new value of shortest path)
          (if desired, add traceback code)
return dist
```

# IMPLEMENTATIONS AND RUNNING TIMES

The simplest implementation is to store vertices in an array or linked list. This will produce a running time of

$$O(|V|^2 + |E|)$$

For sparse graphs, or graphs with very few edges and many nodes, it can be implemented more efficiently storing the graph in an adjacency list using a binary heap or priority queue. This will produce a running time of

$$O((|E|+|V|) \log |V|)$$

# DIJKSTRA'S ALGORITHM - WHY IT WORKS

- As with all greedy algorithms, we need to make sure that it is a correct algorithm (e.g., it *always* returns the right solution if it is given correct input).
- A formal proof would take longer than this presentation, but we can understand how the argument works intuitively.
- If you can't sleep unless you see a proof, see the second reference or ask us where you can find it.

# DIJKSTRA'S ALGORITHM - WHY IT WORKS

- To understand how it works, we'll go over the previous example again. However, we need two mathematical results first:
- **Lemma 1: Triangle inequality**  
If  $\delta(u,v)$  is the shortest path length between  $u$  and  $v$ ,  
$$\delta(u,v) \leq \delta(u,x) + \delta(x,v)$$
- **Lemma 2:**  
The subpath of any shortest path is itself a shortest path.
- The key is to understand why we can claim that anytime we

CALL OR WHATSAPP:689 45 44 70

# DIJKSTRA'S ALGORITHM - WHY USE IT?

- As mentioned, Dijkstra's algorithm calculates the shortest path to every vertex.
- However, it is about as computationally expensive to calculate the shortest path from vertex  $u$  to every vertex using Dijkstra's as it is to calculate the shortest path to some particular vertex  $v$ .
- Therefore, anytime we want to know the optimal path to some other vertex from a determined origin, we can use Dijkstra's algorithm.
